INTRODUCTION

Project Overview

Due to its quickness and occasional comfort, air travel has become more and more popular among tourists during the past 20 years. The result has been a spectacular increase in land traffic and air traffic. Massive levels of aircraft delays on the ground and in the air have also been brought on by an increase in air traffic. There have been significant monetary and environmental losses as a result of these delays. To optimize flight operations and reduce delays, the model's primary goal is to estimate flight delays accurately.

Flight arrival delays can be predicted using a machine learning algorithm. Rows of feature vectors, such as departure date, delay, travel time between the two airports, and scheduled arrival time, provide the input to our algorithm. The Support Vector Machine is then used to determine whether or not the flight arrival will be delayed. When there is more than a 15-minute gap between the scheduled and actual arrival timings, a flight is deemed to be delayed. Flight delay forecasting can enhance airline operations and passenger happiness, which will boost the economy. Comparing the effectiveness of machine learning classification systems for predicting flight delays is the major objective. Flight delays are unavoidable, and they significantly affect the carriers' profits and losses. The traveler's ability to plan ahead and avoid wasting vital time can be greatly aided by this delay prediction. For airlines, estimating flight delays correctly is essential since the data may be used to boost client happiness and revenue for airline agencies.

LITERATURE SURVEY

2.3 Problem Statement Definition

Problem Statement: Passenger flights getting delayed

Defining the Problem:

Question	Description
Who does the problem affect?	Passengers who are in emergency situation to reach destination
What is the issue?	An airline flight takes off and lands later than its scheduled time. A cancellation occurs when the airline does not operate the flight at all for a certain reason. However, depending on why the flight was canceled, finding seats on a new flight will also be difficult and may change travel plans
When does the issue occur?	The issue occurs when there are adverse weather conditions, if the flight is waiting for cargo or crew or if the airport staff strike.
Where is the issue occurring?	Airport
Why is it important that we fix the problem?	Flight delays cause inconvenience for both airline companies and passengers. They cause a decrease in efficiency, an increase in capital costs, reallocation of flight crew and aircraft, and additional crew expenses and require the consumption of extra labor, capital, and other inputs necessary in the process. Another impact of flight delay can be a risk which represents dissatisfaction of passengers and their loss in time.

Proposed Solution

PROBLEM STATEMENT

For several reasons, flying is substantially more exciting for an ordinary traveller than utilizing other modes of transportation. The first is that it is the fastest way of transportation, followed by the comfort it gives in that it is a somewhat quieter and well air-conditioned mode of transit. In addition, it is a more organized style of traveling since staff members support and assist

visitors in every way possible. Land traffic and aviation travel have dramatically increased as a result. A rise in air traffic has also resulted in extremely high levels of aircraft delays both on the ground and in the air.

SOLUTION DESCRIPTION

The main objective of the model is to accurately estimate airplane delays. The entire system is a web application. We employ HTML, CSS, and JavaScript to make the application user interactive. The flight delay is predicted using a ML model. This model accepts inputs as departure date, departure delay, travel time between the two airports, and other data. By turning the ML model to a pickle file, it is linked to a web application. The ML model here uses random forest as its prediction method. Because of its rapid prediction, impressiveness, excellence with high dimensionality, etc., random forest is selected.

CUSTOMER SATISFACTION

An accurate estimation of flight delay can help to increase customer satisfaction and incomes of airline agencies. The delay information can reduce anxiety and tension among passengers thus, saving their time and improving their travel experience, which is significant to enhance passengers' loyalty to an airline.

FINANCIAL BENEFIT MODEL

Predicting flight delays prevents reallocation of flight crew and aircraft and additional crew expenses. This avoids consumption of extra labour, capital and other inputs necessary in the process thereby saving the capital costs. The proposed solution is also a low-cost model and the customers are not charged for the service they receive.

SCALABILITY

The model's ability to increase its performance is possible by building it more accurately with the use of several classification models and selecting the best accurate model among them. Also, through integration of these models, an optimized hybrid model can be obtained in order to result in more scalability. Deploying the ML model into cloud also makes it easy for enterprises to experiment with the model capabilities and scale up. Placing a finished flight prediction model into a live environment can be used for its intended purpose and it is integrated with Flask, so that they can be accessed by end users.

PROBLEM STATEMENTS

Problem Statements

Adam is a user, who needs to **take an layover flight**, and **wants to know the approximate hours** of delay, **so that he can take an alternate flight**

Jimmy is a normal user who **wants to get entertained in some way** so that **he doesn't feel bored.**

Nikita is a normal user who **wants to know how much time is it going to be delayed** so that she can **visit nearby places if possible.**

Rita has the flight scheduled at night and wants to **know if accomodation be provided** so she **doesnt miss the day's sleep.**

Problem Statements

Alice is a **business professional** having an important client meeting, needs to **know the ETD**, so she can **make alternate accomodations**

Robert is in middle of an important event and wants to **know if his flight would be delayed,** so that **he can stay till the event completes.**

Joy is the incharge for inventory at an airport and **wants to know if a flight gets delayed**, so that he could **allot the inventory/resources planned for this fight to some other flight** when there are just enough resources.

Joy also would **wish to know if a flight is delayed** and by how much so that he could **arrange for its required resources well in advance**.

Problem Statements

Sharma is the head of the public relations department and needs to **know if a flight gets delayed**, so that he could make arrangements for **notifying the passengers** regarding the delay through the airline's application.

Stefan is the manager of the catering team of the airlines and needs to **know if a flight gets delayed** so that he could make **arrangements for serving food and refreshments** to the passengers.

REQUIREMENT ANALYSIS

Functional requirement

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through form Registration through email
FR-2	User Confirmation	OTP verification for confirmation
FR-3	Dashboard and Search	Search for flights by entering the flight details Get to know the details of the flight and other flights
FR-4	View flight details	View the details of the flight View if there were any delays previously
FR-5	Display prediction results	Based on the input given by the user predict the delay Display the prediction results to the user

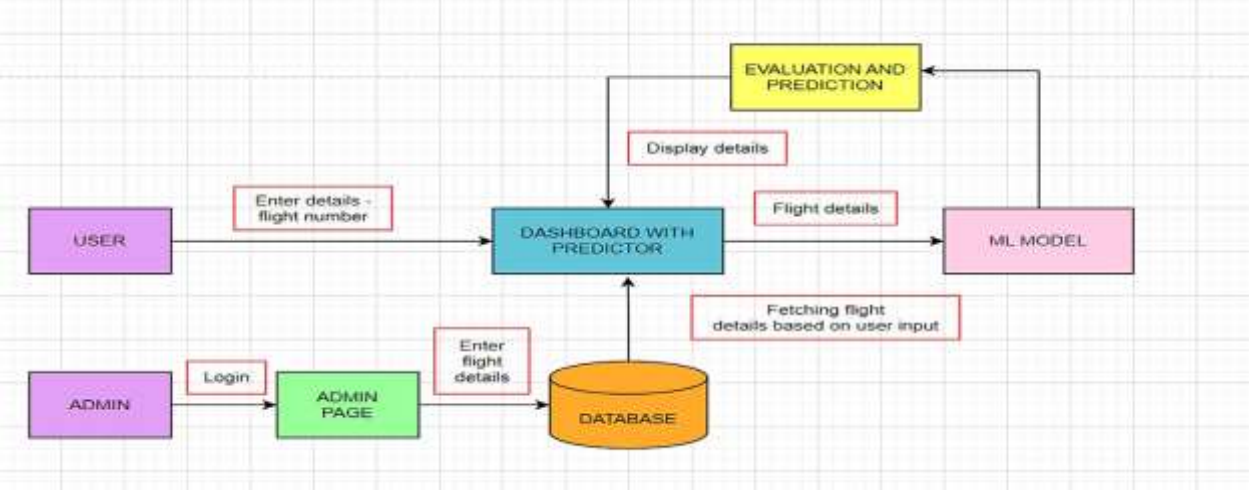
Non-Functional requirements

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Compatible with all browsers
NFR-2	Security	The application will be designed in such a way that the user data won't be let out and is secure

NFR-3	Reliability	The application will be fast enough and be run on cloud servers to ensure there is no DoS
NFR-4	Performance	High accuracy predictions
NFR-5	Availability	Available 24/7 as it is deployed in cloud
NFR-6	Scalability	Scalable to a very large extent. The only limit is the amount invested to buy cloud services.

PROJECT DESIGN

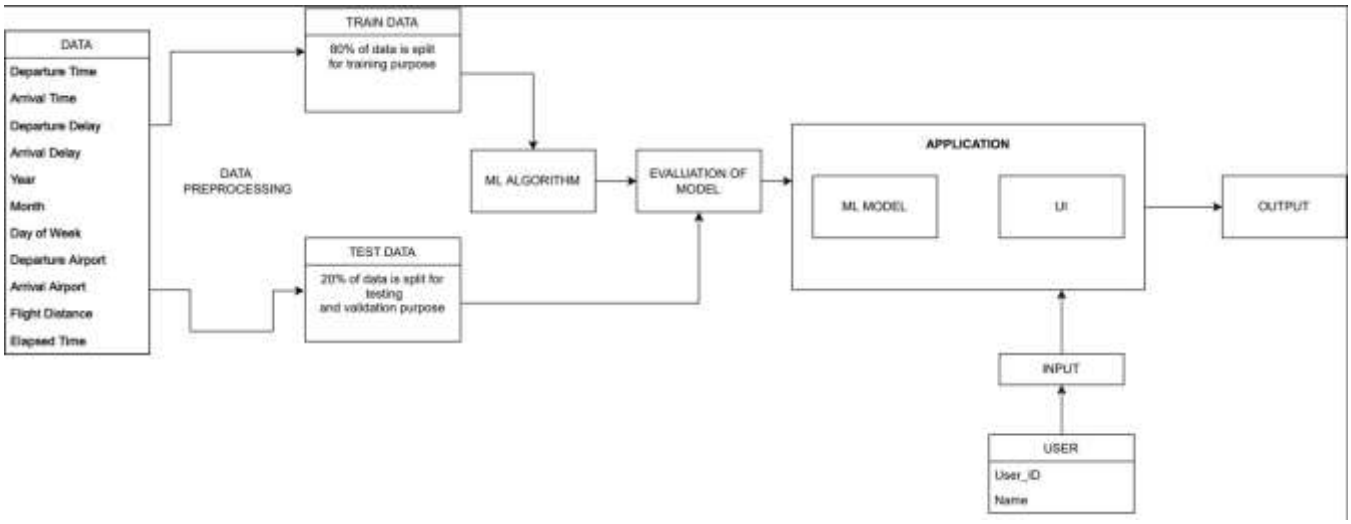
Data Flow Diagrams



Data Flow Diagrams

Solution & Technical Architecture

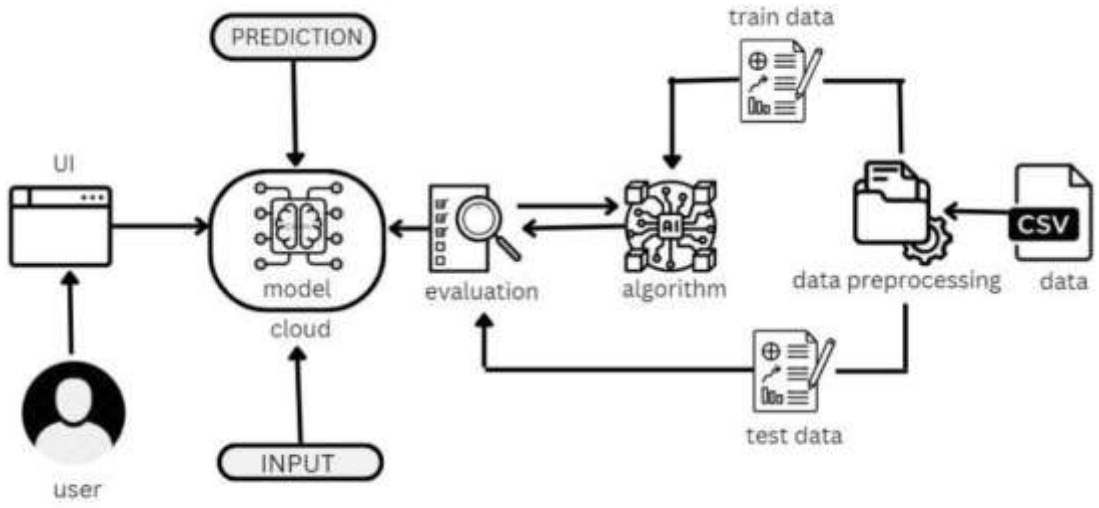
Solution Architecture



Solution Architecture

Technical Architecture

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2.



Technical Architecture

Table-1: Components & Technologies:

S.No.	Component	Description	Technology
1.	User Interface	How the user interacts with application e.g. Web UI, Mobile App, Chatbot etc.	HTML, CSS, JavaScript / Angular Js / React Js etc.
2.	Application Logic-1	Using Python's regularization approach with Regression Analysis to create predictions about future delays	Python
3.	Application Logic-2	Build, run and manage AI models	IBM Watson Machine Learning service
4.	Database	Data Type, Configurations etc.	MySQL, NoSQL, etc.

5.	Cloud Database	Database Service on Cloud	IBM DB2, IBM Cloudant etc.
6.	File Storage	File storage requirements	IBM Block Storage or Other Storage Service or Local Filesystem
7.	External API-1	Defines communication	
between customer and the administration	Flask (Python), etc.		
8.	Machine Learning Model	To predict flight delay model	Object Recognition Model, etc.
9	Infrastructure (Server / Cloud)	Application Deployment on Local System / Cloud Local Server Configuration: local host server on which flask runs Cloud Server Configuration: Cloud object storage	Local, Cloud Foundry, Kubernetes, etc.
Table-2: Application Characteristics:			
S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	List the opensource frameworks used	Flask(python)
2.	Security Implementations	List all the security / access controls implemented, use of firewalls etc.	e.g. SHA-256, Encryptions, IAM Controls, OWASP etc.

3.	Scalable Architecture	Justify the scalability of architecture (3 – tier, Micro-services)	Flask or ML
4.	Availability	Justify the availability of application (e.g. use of load balancers, distributed servers etc.)	Flask or ML
5.	Performance	Design consideration for the performance of the application (number of requests per sec, use of	
Cache, use of CDN's) etc.	Flask or ML		

PROJECT PLANNING AND SCHEDULING

Sprint Planning & Estimation

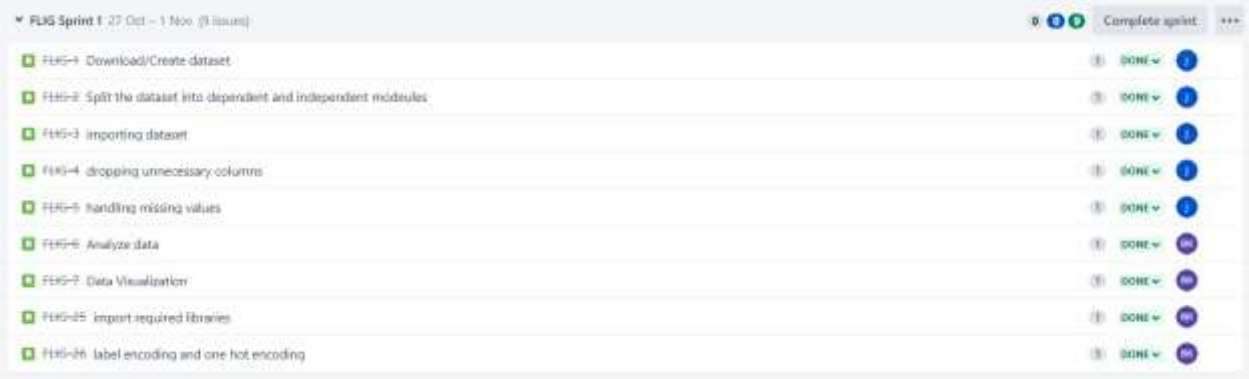
Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members

Sprint-1	Registrati on	USN-1	As a user, I can register for the applicati on by entering my email, password, and confirmi ng my password.	2	High	Blessy Karunya J
Sprint-2	Confirmati on email	USN-2	As a user, I will receive confirmati on email once I have registered for the applicatio n.	2	Medium	Dhanushree B
Sprint-1	User Login	USN-3	As a user, I can log into the applicati on by entering email & password	2	High	Jasmitha R

Sprint-2	Admin panel	USN-4	As an admin, I can authentica te the registrati on and login credentia ls of the passenger s.	2	High	Varshini S
Sprint-3	Arrival and Departure time of flights	USN-5	As a user, I can find all the details of a specific flight with its number or name.	2	High	Blessy Karunya J
Sprint-3		USN-6	As a user, I can find exactly how long the flight will be delayed.	2	High	Dhanushree B
Sprint-4	Helpdesk	USN-7	As a customer care executive, I can provide airline details for contact.	1	Medium	Jasmitha R

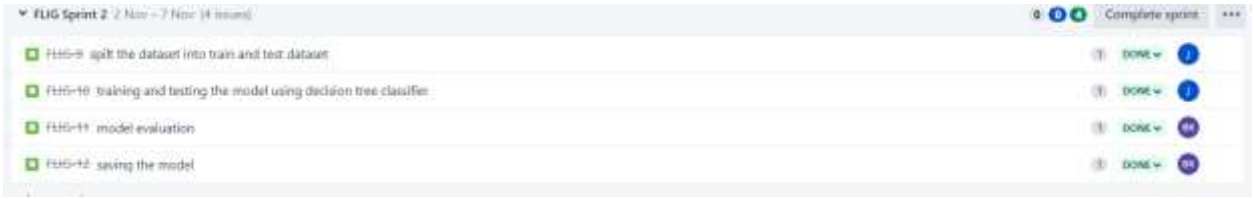
Sprint-4		USN-8	As a passenger, I am able to find available alternative flights to the destination.	1	High	Blessy Karunya J Dhanushree B Jasmitha R Varshini S
Sprint-4	Feedback	USN-9	As a user, I can provide my suggestions and feedback for the improvement of the application.	2	Medium	Varshini S

Reports from JIRA



Tasks to be performed in Sprint 1

The above figure displays the various tasks to be performed in sprint 1. The goal of the sprint 1 is to prepare data for model training. There are nine issues that need to be addressed in the sprint 1. The story points of each issue is mentioned in the above diagram.

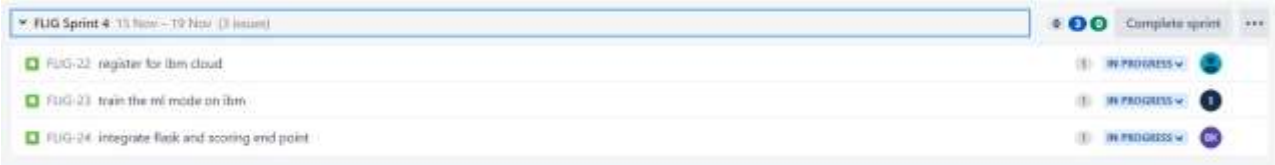


Tasks to be performed in Sprint 2

The above figure displays the various tasks to be performed in sprint 2. The goal of the sprint 2 is to train and save the model. There are four issues that need to be addressed in the sprint 2. The story points of each issue is mentioned in the above diagram.

Tasks to be performed in Sprint 3

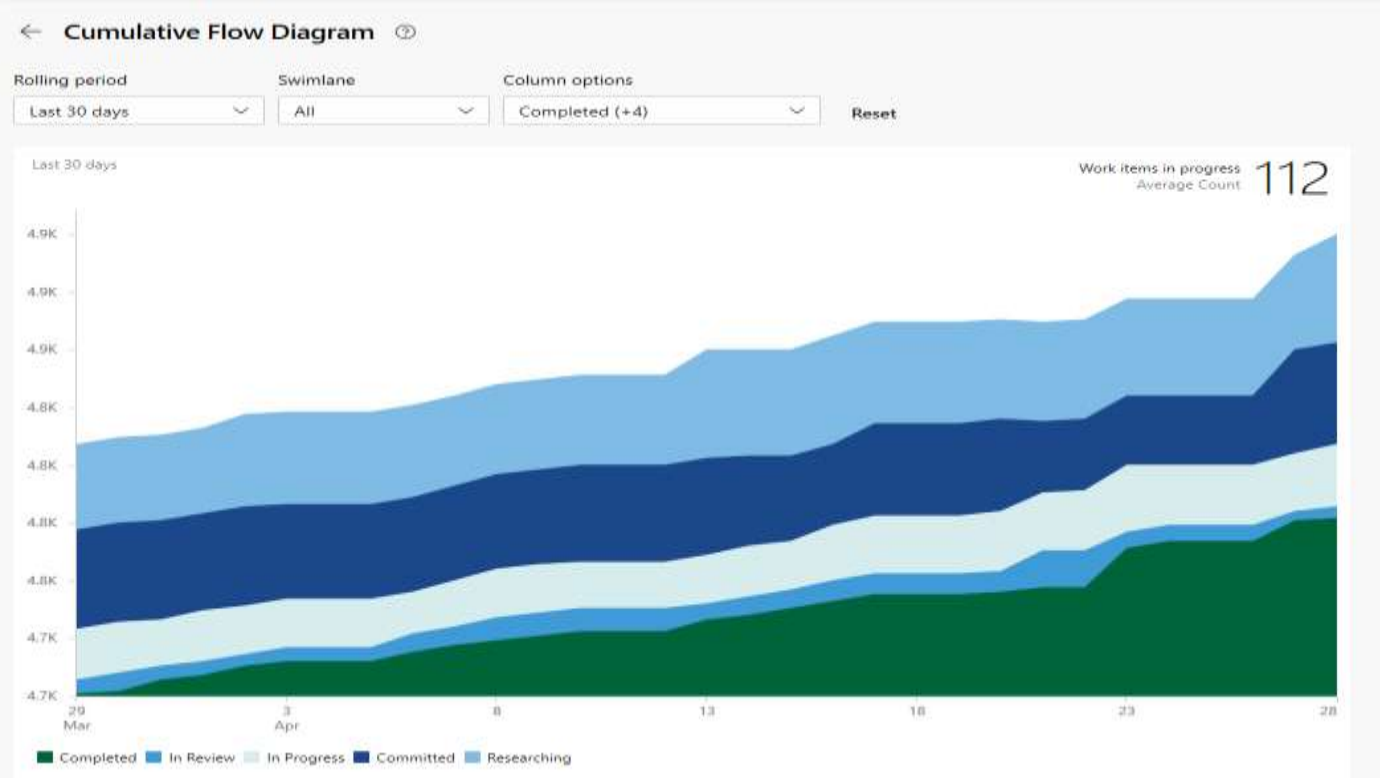
The above figure displays the various tasks to be performed in sprint 3. The goal of the sprint 3 is to build the application and execute the model. There are three issues that need to be addressed in the sprint 3. The story points of each issue are mentioned in the above diagram.



Tasks to be performed in Sprint 4

The above figure displays the various tasks to be performed in sprint 4. The goal of the sprint 4 is to integrate the model with the application. There are three issues that need to be addressed in the sprint 3. The story points of each issue are mentioned in the above diagram.

Cumulative flow



Cumulative flow diagram

CODING & SOLUTIONING

We completed four sprints—Sprint 1, Sprint 2, Sprint 3 and Sprint 4—during the project development phase. A sprint is a predetermined amount of time in Agile product development during which particular tasks must be finished and prepared for review.

Sprint 1

The dataset has been downloaded. The features are analysed and visualized and data has been cleaned and pre-processed using techniques like encoding. The independent and dependent variables are then identified and the dataset is split into train and test sets. Several machine learning algorithms have been applied for classification like logistic regression, decision tree classifier, KNN classifier, random forest classifier and it is found that logistic regression gives the highest accuracy, so it is used for deployment. The model is then dumped into a pickle file.

Sprint 2

We had done building HTML files, writing Python code, and running the application during Sprint 2. The source code is attached in the appendix for reference.

Sprint 3

We then asked users to enter numerical and selection data and tested for many inputs and checked the correctness of the result during sprint 3.

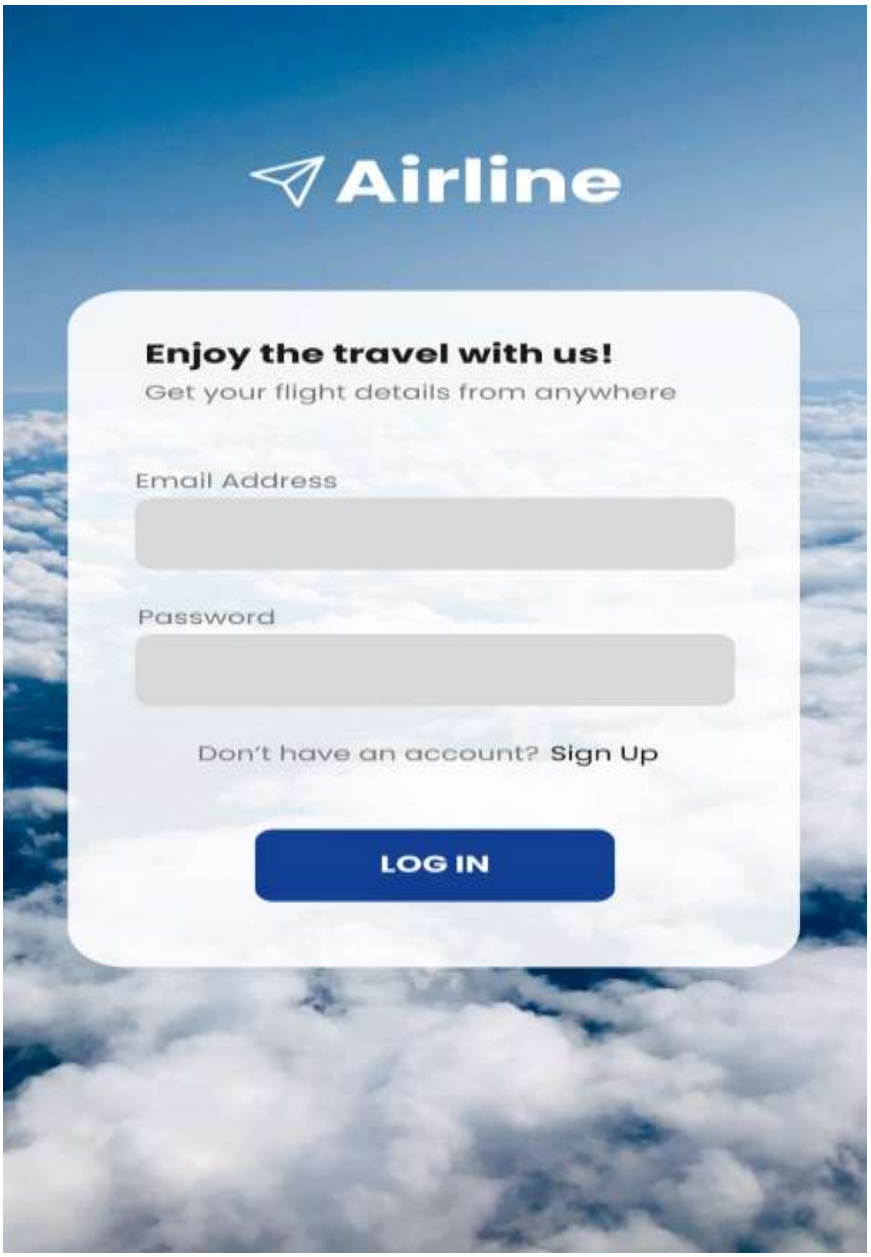
Sprint 4

We trained the model on IBM where we will register for IBM cloud, train the ML model on IBM and integrate flask with scoring end point. Registered on IBM cloud and activated Watson machine learning, cloud storage and Watson studio then trained the ML model on IBM using API KEY during sprint 4.

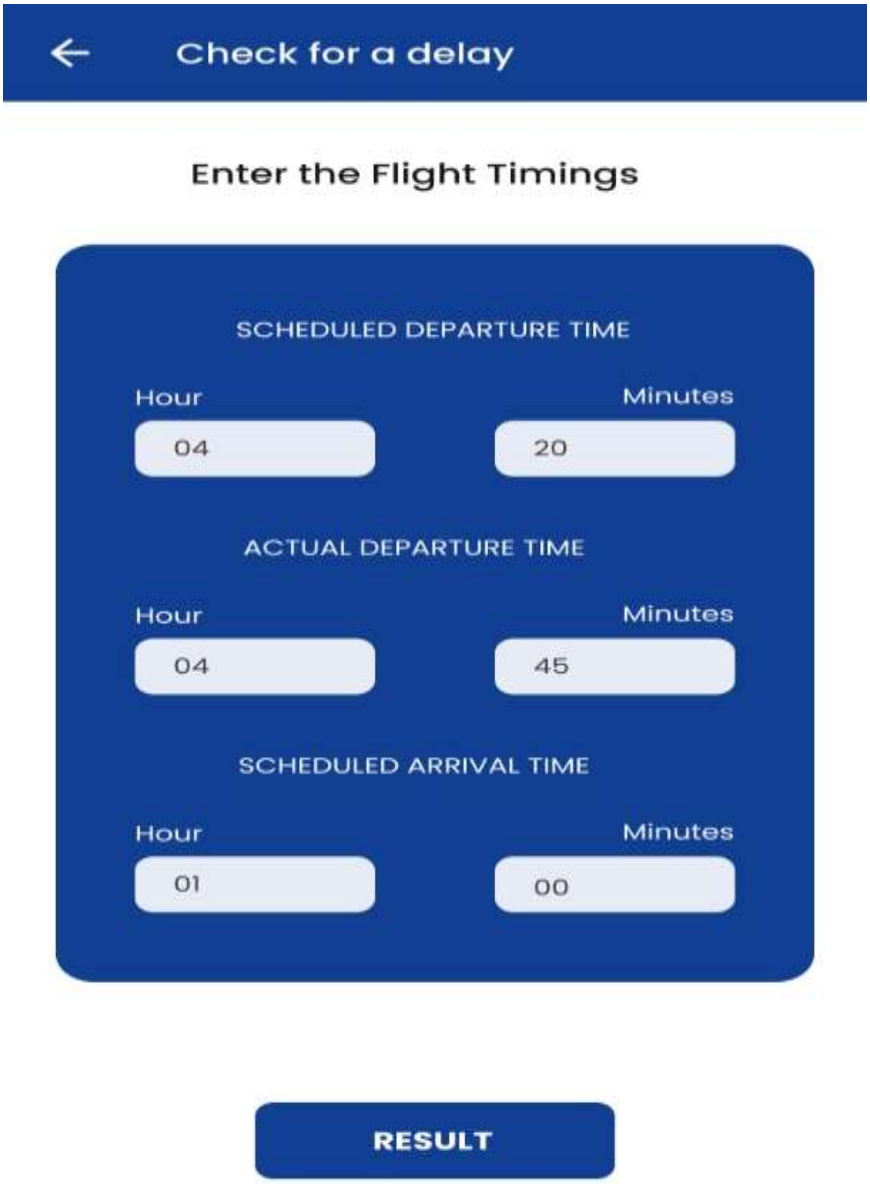
TESTING

Test Cases

Test case 1: The designed application predicts if the flight is delayed.



Test case 2: The designed application predicts if the flight is not delayed.



Deployment testing phase: DONE

Result

Sorry, your flight will be delayed

BACK TO HOMEPAGE

Can the user be able to make use of cloud-deployed ML model and run it in local machine using the API key? YES

The below table shows the number of test cases that have passed, failed and untested.

Section	Total cases	Not Tested	Fail	Pass
Home Screen	1	0	0	1
User input	4	0	0	4
Flight delay testing	2	0	0	2
No flight delay testing	2	0	0	2
Version control	1	0	0	1

RESULTS

Performance metrics

Model: Logistic Regression performance values

There is no big variation in the training and testing accuracy. Therefore, the Logistic Regression model is not overfit or underfit.

```
log_train_acc = accuracy_score(Y_train, Y_pred_log_train)
log_test_acc = accuracy_score(Y_test, Y_pred_log_test)
print('Training Accuracy =', log_train_acc)
print('Testing Accuracy =', log_test_acc)
```

[42]

```
Training Accuracy = 0.9206366874443455
Testing Accuracy = 0.9194481530930129
```

Model: Decision tree Classifier

There is a variation in the training and testing accuracy. The Decision tree classifier model is overfit. So, it is not chosen for best results.

```
clf_train_acc = accuracy_score(Y_train, Y_pred_clf_train)
clf_test_acc = accuracy_score(Y_test, Y_pred_clf_test)
print('Training Accuracy =', clf_train_acc)
print('Testing Accuracy =', clf_test_acc)
```

[46]

```
Training Accuracy = 1.0
Testing Accuracy = 0.8722741433021807
```

Model: KNN Classifier

There is no big variation in the training and testing accuracy. Therefore, the KNN Classifier model is not overfit or underfit.

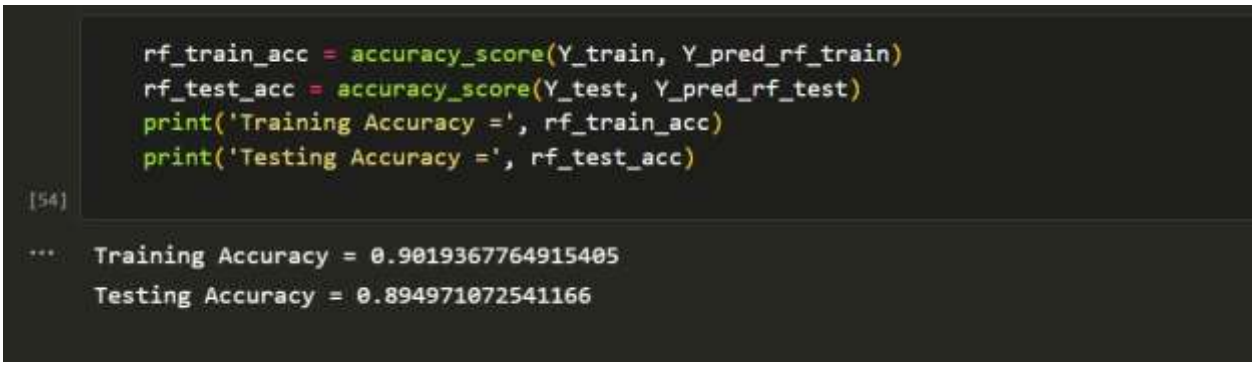
```
knn_train_acc = accuracy_score(Y_train, Y_pred_knn_train)
knn_test_acc = accuracy_score(Y_test, Y_pred_knn_test)
print('Training Accuracy =', knn_train_acc)
print('Testing Accuracy =', knn_test_acc)
```

[50]

```
Training Accuracy = 0.8876892252894034
Testing Accuracy = 0.8629283489096573
```

Model: Random Forest Classifier

There is no big variation in the training and testing accuracy. Therefore, the Random Forest Classifier model is not overfit or underfit.



```
[54]
    rf_train_acc = accuracy_score(Y_train, Y_pred_rf_train)
    rf_test_acc = accuracy_score(Y_test, Y_pred_rf_test)
    print('Training Accuracy =', rf_train_acc)
    print('Testing Accuracy =', rf_test_acc)

... Training Accuracy = 0.9019367764915405
    Testing Accuracy = 0.894971072541166
```

On comparing the four models built, based on the performance metrics it is clear that logistic regression gives the highest performance. Hence, that model is chosen for deployment.

ADVANTAGES & DISADVANTAGES

Advantages

- ✓ The application is fast and offers great accuracy in predicting the flight delay.
- ✓ Less maintenance is required.
- ✓ It is user friendly.
- ✓ It helps in reducing the tension of the passengers in knowing how long they will have to wait and lets passengers plan their schedule accordingly, thus in a way saving their time.

Disadvantages

- ✓ It requires an internet connection for the website to work.

CONCLUSION

Flight delays not only anger and disturb air travellers' plans, but they also reduce efficiency, raise capital costs, reallocate flight crews and aircraft, and add to crew costs.

The goal of the flight delay prediction model is to forecast aircraft delays caused as a lot of passengers have become dependent on flights these days for their mode of transportation. The dataset which has all important information about the flights and its delay is made use for developing the model. A lot of steps are performed right from importing the data, then pre-processing it till training and testing the model. First the necessary packages were imported then the missing values in the data were handled and it was checked for outliers and then one hot encoding was performed and scaling was done. Then the data was split and given for training.

Four different models were used for training and out of it the best one was chosen based on the performance metric which is the Logistic regression model. Once the model was built it was integrated along with the Flask framework so that the users can enter their flight details and see if the flight would be on time or get delayed. Then this model is trained and deployed in the IBM Cloud.

As a result, anticipating delays can enhance airline operations and passenger satisfaction, which will benefit the economy and bring a positive impact.

FUTURE SCOPE

In the future, the application can be included with an user authentication model. Apart from checking if the flight would get delayed or not, their search history can be maintained and personalized flight recommendations can be done. A section where the users can give their feedback can also be implemented.
